Warning

gradio.Warning(...)

Description

This function allows you to pass custom warning messages to the user. You can do so simply by writing `gr.Warning('message here')` in your function, and when that line is executed the custom message will appear in a modal on the demo. The modal is yellow by default and has the heading: "Warning." Queue must be enabled for this behavior; otherwise, the warning will be printed to the console using the `warnings` library.

Example Usage

```
import gradio as gr

def hello_world():
    gr.Warning('This is a warning message.')
    return "hello world"

with gr.Blocks() as demo:
    md = gr.Markdown()
    demo.load(hello_world, inputs=None, outputs=[md])
demo.queue().launch()
```

Initialization

Parameter

Description

message

The warning message to be displayed to the user.

str

default: "Warning issued."

blocks_chained_events

```
import gradio as gr
import time

def failure():
    raise gr.Error("This should fail!")

def exception():
    raise ValueError("Something went wrong")

def success():
    ...
```
