State

gradio.State(...)

Description

A base class for defining methods that all input/output components should have.

Behavior

As input: undefined

As output: undefined

Initialization

Parameter	Description
<div>value</div> <div>Any</div> <div>default: None</div>	the initial value (of arbitrary type) of the state. The provided argument is deepcopied. If a callable is provided, the function will be called whenever the app loads to set the initial value of the state.
<div>render</div> <div>bool</div> <div>default: True</div>	has no effect, but is included for consistency with other components.
