Info

```
gradio.Info(...)
```

Description

This function allows you to pass custom info messages to the user. You can do so simply by writing `gr.Info('message here')` in your function, and when that line is executed the custom message will appear in a modal on the demo. The modal is gray by default and has the heading: "Info." Queue must be enabled for this behavior; otherwise, the message will be printed to the console.

Example Usage

```
import gradio as gr
def hello_world():
    gr.Info('This is some info.')
    return "hello world"
with gr.Blocks() as demo:
    md = gr.Markdown()
    demo.load(hello_world, inputs=None, outputs=[md])
demo.queue().launch()
```

Initialization

Parameter	Description
<div>message</div> <div>str</div> <div>default: "Info issued."</div>	The info message to be displayed to the user.

Demos

```
import gradio as gr
import time

def failure():
    raise gr.Error("This should fail!")

def exception():
    raise ValueError("Something went wrong")

def success():
    return "Success!"
```
