# Dropdown

 $gradio.Dropdown(\cdots)$ 

# Description

Creates a dropdown of choices from which entries can be selected.

### Behavior

As input: passes the value of the selected dropdown entry as a str or its index as an int into the function, depending on type.

As output: expects a str corresponding to the value of the dropdown entry to be selected.

### Initialization

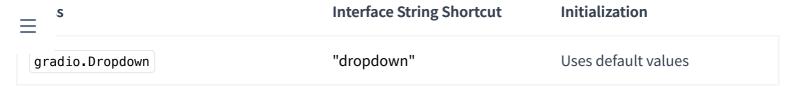

default: "value"

Parameter	Description
choices  list[str   int   float   tuple[str, str   int   float]]   None  default: None	A list of string options to choose from. An option can also be a tuple of the form (name, value), where name is the displayed name of the dropdown choice and value is the value to be passed to the function, or returned by the function.
<pre>value str   int   float   list[str   int   float]   Callable   None default: None</pre>	default value(s) selected in dropdown. If None, no value is selected by default. If callable, the function will be called whenever the app loads to set the initial value of the component.
type  Literal[('value', 'index')]	Type of value to be returned by component. "value" returns the string of the choice selected, "index" returns the index of the

choice selected.

ımeter	Description
multiselect	if True, multiple choices can be selected.
bool   None	
default: None	
allow_custom_value	If True, allows user to enter a custom value that is not in the list
bool	of choices.
default: False	
max_choices	maximum number of choices that can be selected. If None, no
int   None	limit is enforced.
default: None	
filterable	If True, user will be able to type into the dropdown and filter the
bool	choices by typing. Can only be set to False if allow_custom_value is
default: True	False.
label	The label for this component. Appears above the component and
str   None	is also used as the header if there are a table of examples for this
default: None	component. If None and used in a gr. Interface, the label will be
	the name of the parameter this component is assigned to.
info	additional component description.
str   None	
default: None	
every	If value is a callable, run the function 'every' number of seconds
float   None	while the client connection is open. Has no effect otherwise.
default: None	Queue must be enabled. The event can be accessed (e.g. to
	cancel it) via this component's .load_event attribute.
show_label	if True, will display label.
bool   None	
default: None	

Description ımeter container If True, will place the component in a container - providing some extra padding around the border. bool default: True scale relative width compared to adjacent Components in a Row. For example, if Component A has scale=2, and Component B has int | None scale=1, A will be twice as wide as B. Should be an integer. default: None min\_width minimum pixel width, will wrap if not sufficient screen space to satisfy this value. If a certain scale value results in this int default: 160 Component being narrower than min\_width, the min\_width parameter will be respected first. interactive if True, choices in this dropdown will be selectable; if False, selection will be disabled. If not provided, this is inferred based bool | None on whether the component is used as an input or output. default: None visible If False, component will be hidden. bool default: True elem\_id An optional string that is assigned as the id of this component in the HTML DOM. Can be used for targeting CSS styles. str | None default: None elem\_classes An optional list of strings that are assigned as the classes of this component in the HTML DOM. Can be used for targeting CSS list[str] | str | None default: None styles. render If False, component will not render be rendered in the Blocks context. Should be used if the intention is to assign event bool default: True listeners now but render the component later.

#### Demos

```
import gradio as gr

def sentence_builder(quantity, animal, countries, place, activity_list, morning):
    return f"""The {quantity} {animal}s from {" and ".join(countries)} went to the {place}
    where they {" and ".join(activity_list)} until the {"morning" if morning else "night"}"""

demo = gr.Interface(
    sentence_builder,
    [
```

### **Event Listeners**

### Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

# Supported Event Listeners

The Dropdown component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description
gradio.Dropdown.change(fn, ···)	Triggered when the value of the Dropdown changes either because of user input (e.g. a user types in a textbox) OR because of a function update (e.g. an image receives a value from the output of an event trigger). See <a href="input()">.input()</a> for a listener that is only triggered by user input.

Listener

<pre>gradio.Dropdown.input(fn,)</pre>	This listener is triggered when the user changes the value of the Dropdown.
<pre>gradio.Dropdown.select(fn,)</pre>	Event listener for when the user selects or deselects the Dropdown. Uses event data gradio. SelectData to carry value referring to the label of the Dropdown, and selected to refer to state of the Dropdown. See EventData documentation on how to use this event data
gradio.Dropdown.focus(fn, ···)	This listener is triggered when the Dropdown is focused.
gradio.Dropdown.blur(fn, ···)	This listener is triggered when the Dropdown is unfocused/blurred.

Description

# **Event Arguments**

Parameter	Description
-----------	-------------

Callable | None | Literal['decorator']

default: "decorator"

the function to call when this event is triggered. Often a machine learning model's prediction function. Each parameter of the function corresponds to one input component, and the function should return a single value or a tuple of values, with each element in the tuple corresponding to one output component.

inputs

fn

Component | list[Component] |
set[Component] | None

default: None

List of gradio.components to use as inputs. If the function takes no inputs, this should be an empty list.

outputs

Component | list[Component] | None

default: None

List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.

Parameter	Description
api_name  str   None   Literal[False]  default: None	defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that gr.load this app) will not be able to use this event.
scroll_to_output  bool  default: False	If True, will scroll to output component on completion
show_progress  Literal[('full', 'minimal', 'hidden')]  default: "full"	If True, will show progress animation while pending
queue bool   None default: None	If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the queue setting of the gradio app.
batch  bool  default: False	If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to length <a href="max_batch_size">max_batch_size</a> ). The function is then <i>required</i> to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to on output component.
<pre>max_batch_size int default: 4</pre>	Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)

Parameter	Description
bool default: True	If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the <a href="mage">Tmage</a> component).
postprocess  bool  default: True	If False, will not run postprocessing of component data before returning 'fn' output to the browser.
cancels  dict[str, Any]   list[dict[str, Any]]   None  default: None	A list of other events to cancel when this listener is triggered.  For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another components .click method. Functions that have not yet run (or generators that are iterating) will be cancelled, but functions that are currently running will be allowed to finish.
every  float   None  default: None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be enabled.
<pre>trigger_mode  Literal[('once', 'multiple', 'always_last')]   None default: None</pre>	If "once" (default for all events except .change()) would not allow any submissions while an event is pending. If set to "multiple", unlimited submissions are allowed while pending, and "always_last" (default for .change() event) would allow a second submission after the pending event is complete.

js

str | None

default: None

Optional frontend js method to run before running 'fn'. Input

arguments for js method are values of 'inputs' and 'outputs',

return should be a list of values for output components.

=	Parameter	Description	
	<pre>concurrency_limit int   None   Literal['default'] default: "default"</pre>	If set, this is the maximum number of this event that can be running simultaneously. Can be set to None to mean no concurrency_limit (any number of this event can be running simultaneously). Set to "default" to use the default concurrency limit (defined by the default_concurrency_limit parameter in Blocks.queue(), which itself is 1 by default).	
	concurrency_id  str   None  default: None	If set, this is the id of the concurrency group. Events with the same concurrency_id will be limited by the lowest set concurrency_limit.	
← []	show_api bool Dataset ::True	whether to show this event in the "view API" page of the Gradio app, or in the ".view_api()" method of the Gradio clients. Unlike setting api_name to F; DuplicateButton → to False will still allow downstream apps to use this event. If	

📀 gradio

fn is None, show\_api will automatically be set to False.
