Dataset

gr.Dataset(components, samples)

Description

Used to create an output widget for showing datasets. Used to render the examples box.

Behavior

As input: passes the selected sample either as a list of data (if type="value") or as an int index (if type="index")

Description

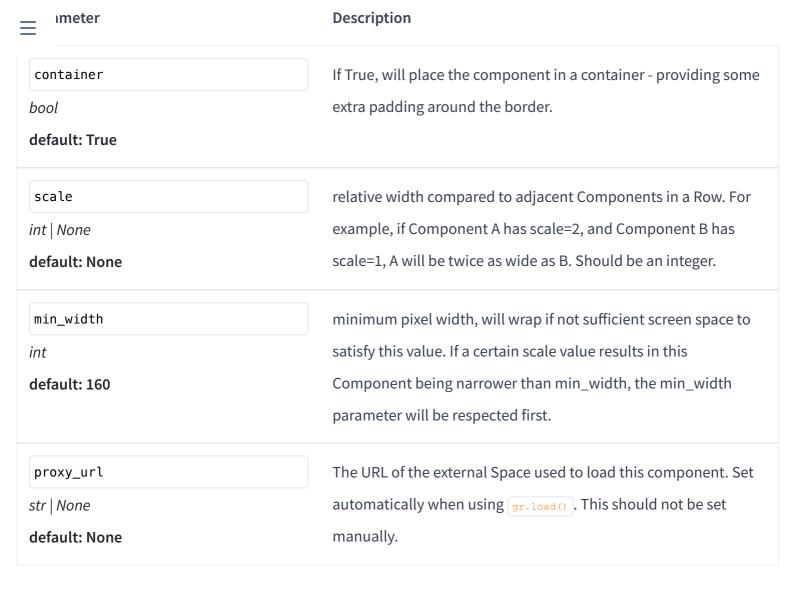

As output: expects a list of lists corresponding to the dataset data.

Initialization

Parameter

label	
str None	
default: None	
components	Which component types to show in this dataset widget, can be
list[Component] list[str]	passed in as a list of string names or Components instances. The
required	following components are supported in a Dataset: Audio,
	Checkbox, CheckboxGroup, ColorPicker, Dataframe, Dropdown,
	File, HTML, Image, Markdown, Model3D, Number, Radio, Slider,
	Textbox, TimeSeries, Video

imeter	Description
samples	a nested list of samples. Each sublist within the outer list
list[list[Any]] None	represents a data sample, and each element within the sublist
default: None	represents an value for each component
headers	Column headers in the Dataset widget, should be the same len as
list[str] None	components. If not provided, inferred from component labels
default: None	
type	'values' if clicking on a sample should pass the value of the
Literal[('values', 'index')]	sample, or "index" if it should pass the index of the sample
default: "values"	
samples_per_page	how many examples to show per page.
int	
default: 10	
visible	If False, component will be hidden.
bool	
default: True	
elem_id	An optional string that is assigned as the id of this component in
str None	the HTML DOM. Can be used for targeting CSS styles.
default: None	
elem_classes	An optional list of strings that are assigned as the classes of this
list[str] str None	component in the HTML DOM. Can be used for targeting CSS
default: None	styles.
render	If False, component will not render be rendered in the Blocks
bool	context. Should be used if the intention is to assign event
default: True	listeners now but render the component later.

Shortcuts

Class	Interface String Shortcut	Initialization
gradio.Dataset	"dataset"	Uses default values

Event Listeners

Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

Supported Event Listeners

The Dataset component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description	
<pre>gradio.Dataset.click(fn,)</pre>	Triggered when the Dataset is clicked.	

Description

Event listener for when the user selects or deselects the Dataset. Uses event data gradio. SelectData to carry value referring to the label of the Dataset, and selected to refer to state of the Dataset. See EventData documentation on how to use this event data

Event Arguments

Parameter

Description

fn

Callable | None | Literal['decorator']

default: "decorator"

the function to call when this event is triggered. Often a machine learning model's prediction function. Each parameter of the function corresponds to one input component, and the function should return a single value or a tuple of values, with each element in the tuple corresponding to one output component.

inputs

Component | list[Component] |
set[Component] | None

default: None

List of gradio.components to use as inputs. If the function takes no inputs, this should be an empty list.

outputs

Component | list[Component] | None

default: None

List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.

api_name

str | None | Literal[False]

default: None

defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that

gr.load this app) will not be able to use this event.

Parameter	Description
scroll_to_output bool default: False	If True, will scroll to output component on completion
show_progress Literal[('full', 'minimal', 'hidden')] default: "full"	If True, will show progress animation while pending
queue bool None default: None	If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the queue setting of the gradio app.
bool default: False	If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to length <pre>max_batch_size</pre>). The function is then required to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to one output component.
<pre>max_batch_size int default: 4</pre>	Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)
preprocess bool default: True	If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the Tmage component).
postprocess bool	If False, will not run postprocessing of component data before returning 'fn' output to the browser.

default: True

Parameter	Description
cancels dict[str, Any] list[dict[str, Any]] None default: None	A list of other events to cancel when this listener is triggered. For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another components .click method. Functions that have not yet run (or generators that are iterating) will be cancelled, but functions that are currently running will be allowed to finish.
every float None default: None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be enabled.
trigger_mode Literal[('once', 'multiple', 'always_last')] None default: None	If "once" (default for all events except .change()) would not allow any submissions while an event is pending. If set to "multiple", unlimited submissions are allowed while pending, and "always_last" (default for .change() event) would allow a second submission after the pending event is complete.
js str None default: None	Optional frontend js method to run before running 'fn'. Input arguments for js method are values of 'inputs' and 'outputs', return should be a list of values for output components.
<pre>concurrency_limit int None Literal['default'] default: "default"</pre>	If set, this is the maximum number of this event that can be running simultaneously. Can be set to None to mean no concurrency_limit (any number of this event can be running simultaneously). Set to "default" to use the default concurrency limit (defined by the default-concurrency_limit parameter in Blocks.queue (), which itself is 1 by default).
concurrency_id str None default: None	If set, this is the id of the concurrency group. Events with the same concurrency_id will be limited by the lowest set concurrency_limit.
