HTML

 $gradio.HTML(\cdots)$

Description

Used to display arbitrary HTML output.

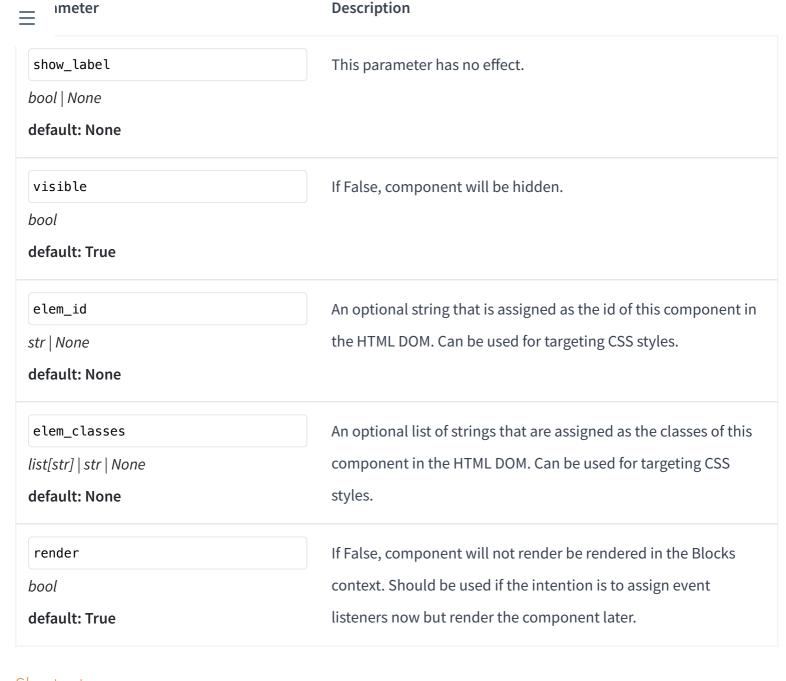

Behavior

As input: this component does *not* accept input.

As output: expects a valid HTML str.

Initialization

Parameter	Description
value str Callable default: ""	Default value. If callable, the function will be called whenever the app loads to set the initial value of the component.
str None default: None	The label for this component. Is used as the header if there are a table of examples for this component. If None and used in a gr.Interface , the label will be the name of the parameter this component is assigned to.
every float None default: None	If value is a callable, run the function 'every' number of seconds while the client connection is open. Has no effect otherwise. Queue must be enabled. The event can be accessed (e.g. to cancel it) via this component's .load_event attribute.

Shortcuts

Class	Interface String Shortcut	Initialization
gradio.HTML	"html"	Uses default values

Demos

```
import gradio as gr
import os
os.system('python -m spacy download en_core_web_sm')
import spacy
from spacy import displacy
```

```
lp = spacy.load("en_core_web_sm")

def text_analysis(text):
    doc = nlp(text)

html = displacy.render(doc, style="dep", page=True)
```

Event Listeners

Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

Supported Event Listeners

The HTML component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description
gradio.HTML.change(fn, ···)	Triggered when the value of the HTML changes either because of user input (e.g. a user types in a textbox) OR because of a function update (e.g. an image receives a value from the output of an event trigger). See .input () for a listener that is only triggered by user input.
	usterier that is only triggered by user input.

Event Arguments

Parameter	Description
fn	the function to call when this event is triggered. Often a
Callable None Literal['decorator']	machine learning model's prediction function. Each
default: "decorator"	parameter of the function corresponds to one input
	component, and the function should return a single value or
	a tuple of values, with each element in the tuple
	corresponding to one output component.

Parameter	Description
<pre>inputs Component list[Component] set[Component] None default: None</pre>	List of gradio.components to use as inputs. If the function takes no inputs, this should be an empty list.
outputs Component list[Component] None default: None	List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.
api_name str None Literal[False] default: None	defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that gr.load this app) will not be able to use this event.
scroll_to_output bool default: False	If True, will scroll to output component on completion
show_progress Literal[('full', 'minimal', 'hidden')] default: "full"	If True, will show progress animation while pending
queue bool None default: None	If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the

queue setting of the gradio app.

Parameter	Description
batch bool default: False	If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to length max_batch_size). The function is then <i>required</i> to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to one output component.
<pre>max_batch_size int default: 4</pre>	Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)
preprocess bool default: True	If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the <code>Image</code> component).
postprocess bool default: True	If False, will not run postprocessing of component data before returning 'fn' output to the browser.
cancels dict[str, Any] list[dict[str, Any]] None default: None	A list of other events to cancel when this listener is triggered. For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another components .click method. Functions that have not yet run (or generators that are iterating) will be cancelled, but functions that are currently running will be allowed to finish.
every float None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be

enabled.

default: None

Description

trigger_mode

Literal[('once', 'multiple', 'always_last')]

None

default: None

If "once" (default for all events except <a href=".change()") would not allow any submissions while an event is pending. If set to "multiple", unlimited submissions are allowed while pending, and "always_last" (default for .change() event) would allow a second submission after the pending event is complete.

js

str | None

default: None

Optional frontend js method to run before running 'fn'. Input arguments for js method are values of 'inputs' and 'outputs', return should be a list of values for output components.

concurrency_limit

int | None | Literal['default']

default: "default"

If set, this is the maximum number of this event that can be running simultaneously. Can be set to None to mean no concurrency_limit (any number of this event can be running simultaneously). Set to "default" to use the default concurrency limit (defined by the default_concurrency_limit parameter in Blocks.queue(), which itself is 1 by default).

concurrency_id

str | None

default: None

If set, this is the id of the concurrency group. Events with the same concurrency_id will be limited by the lowest set concurrency_limit.

show_api

bool

default: True

whether to show this event in the "view API" page of the Gradio app, or in the ".view_api()" method of the Gradio clients. Unlike setting api_name to False, setting show_api to False will still allow downstream apps to use this event. If fn is None, show_api will automatically be set to False.
