# CheckboxGroup

 $gradio.CheckboxGroup(\cdots)$ 

### Description

Creates a set of checkboxes of which a subset can be checked.

#### Behavior

As input: passes the list of checked checkboxes as a List[str | int | float] or their indices as a List[int] into the function, depending on type.

As output: expects a List[str | int | float], each element of which becomes a checked checkbox.

#### Initialization

Parameter	Description

choices

list[str | int | float | tuple[str, str | int | float]]

None

default: None

A list of string or numeric options to select from. An option can also be a tuple of the form (name, value), where name is the displayed name of the checkbox button and value is the value to be passed to the function, or returned by the function.

value

list[str | float | int] | str | float | int | Callable

None

default: None

Default selected list of options. If a single choice is selected, it can be passed in as a string or numeric type. If callable, the function will be called whenever the app loads to set the initial value of the component.

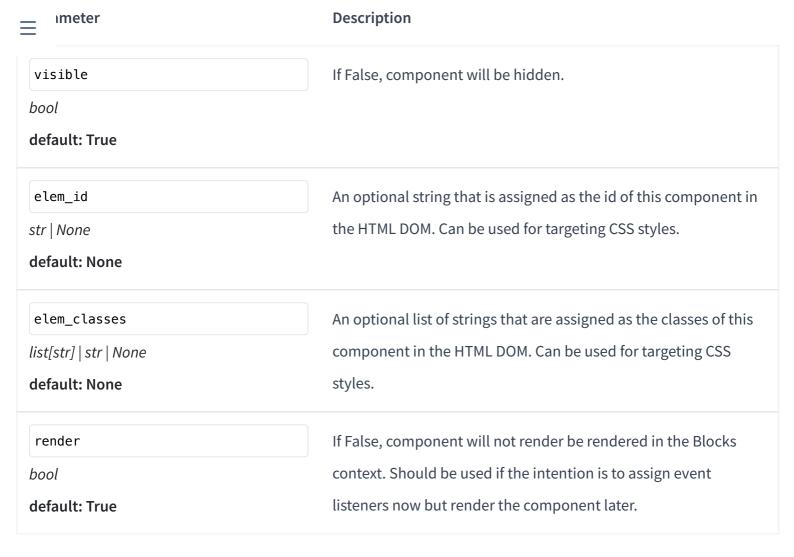

type

Literal[('value', 'index')]

default: "value"

Type of value to be returned by component. "value" returns the list of strings of the choices selected, "index" returns the list of indices of the choices selected.

= imeter	Description
label  str   None  default: None	The label for this component. Appears above the component and is also used as the header if there are a table of examples for this component. If None and used in a <code>gr.Interface</code> , the label will be the name of the parameter this component is assigned to.
info  str   None  default: None	Additional component description.
every  float   None  default: None	If value is a callable, run the function 'every' number of seconds while the client connection is open. Has no effect otherwise.  Queue must be enabled. The event can be accessed (e.g. to cancel it) via this component's .load_event attribute.
show_label  bool   None  default: None	If True, will display label.
container  bool  default: True	If True, will place the component in a container - providing some extra padding around the border.
scale  int   None  default: None	Relative width compared to adjacent Components in a Row. For example, if Component A has scale=2, and Component B has scale=1, A will be twice as wide as B. Should be an integer.
min_width  int  default: 160	Minimum pixel width, will wrap if not sufficient screen space to satisfy this value. If a certain scale value results in this Component being narrower than min_width, the min_width parameter will be respected first.
<pre>interactive bool   None default: None</pre>	If True, choices in this checkbox group will be checkable; if False, checking will be disabled. If not provided, this is inferred based on whether the component is used as an input or output.

### Shortcuts

Class	Interface String Shortcut	Initialization
gradio.CheckboxGroup	"checkboxgroup"	Uses default values

#### Demos

```
import gradio as gr

def sentence_builder(quantity, animal, countries, place, activity_list, morning):
    return f"""The {quantity} {animal}s from {" and ".join(countries)} went to the {place}
    where they {" and ".join(activity_list)} until the {"morning" if morning else "night"}"""

demo = gr.Interface(
    sentence_builder,
```

#### **Event Listeners**

## Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

## Supported Event Listeners

The CheckboxGroup component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description
gradio.CheckboxGroup.change(fn,	Triggered when the value of the CheckboxGroup changes either because of user input (e.g. a user types in a textbox) OR because of a function update (e.g. an image receives a value from the output of an event trigger). See <a href="input()">input()</a> for a listener that is only triggered by user input.
<pre>gradio.CheckboxGroup.input(fn,)</pre>	This listener is triggered when the user changes the value of the CheckboxGroup.
gradio.CheckboxGroup.select(fn,	Event listener for when the user selects or deselects the CheckboxGroup. Uses event data gradio.SelectData to carry value referring to the label of the CheckboxGroup, and selected to refer to state of the CheckboxGroup. See EventData documentation on how to use this event data

## **Event Arguments**

Parameter	Description
fn  Callable   None   Literal['decorator']	the function to call when this event is triggered. Often a machine learning model's prediction function. Each
default: "decorator"	parameter of the function corresponds to one input component, and the function should return a single value or
	a tuple of values, with each element in the tuple corresponding to one output component.

Parameter	Description
<pre>inputs  Component   list[Component]    set[Component]   None  default: None</pre>	List of gradio.components to use as inputs. If the function takes no inputs, this should be an empty list.
outputs  Component   list[Component]   None  default: None	List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.
api_name  str   None   Literal[False]  default: None	defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that gr.load this app) will not be able to use this event.
scroll_to_output  bool  default: False	If True, will scroll to output component on completion
show_progress  Literal[('full', 'minimal', 'hidden')]  default: "full"	If True, will show progress animation while pending
queue  bool   None  default: None	If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the

queue setting of the gradio app.

Parameter	Description
batch bool default: False	If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to length <a href="max_batch_size">max_batch_size</a> ). The function is then <i>required</i> to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to one output component.
<pre>max_batch_size int default: 4</pre>	Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)
preprocess  bool  default: True	If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the <code>Image</code> component).
postprocess  bool  default: True	If False, will not run postprocessing of component data before returning 'fn' output to the browser.
cancels  dict[str, Any]   list[dict[str, Any]]   None  default: None	A list of other events to cancel when this listener is triggered. For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another components .click method. Functions that have not yet run (or generators that are iterating) will be cancelled, but functions that are currently running will be allowed to finish.
every float   None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be

enabled.

default: None

Parameter	Description
trigger_mode  Literal[('once', 'multiple', 'always_last')]   None  default: None	If "once" (default for all events except .change()) would not allow any submissions while an event is pending. If set to "multiple", unlimited submissions are allowed while pending, and "always_last" (default for .change() event) would allow a second submission after the pending event is complete.
js str   None default: None	Optional frontend js method to run before running 'fn'. Input arguments for js method are values of 'inputs' and 'outputs', return should be a list of values for output components.
<pre>concurrency_limit int   None   Literal['default'] default: "default"</pre>	If set, this is the maximum number of this event that can be running simultaneously. Can be set to None to mean no concurrency_limit (any number of this event can be running simultaneously). Set to "default" to use the default concurrency limit (defined by the default_concurrency_limit parameter in Blocks.queue(), which itself is 1 by default).
concurrency_id	If set, this is the id of the concurrency group. Events with the

str | None

default: None

same concurrency\_id will be limited by the lowest set concurrency\_limit.

show\_api

bool

default: True

whether to show this event in the "view API" page of the Gradio app, or in the ".view\_api()" method of the Gradio clients. Unlike setting api\_name to False, setting show\_api to False will still allow downstream apps to use this event. If fn is None, show\_api will automatically b ClearButton →
