# Image

 $gradio.Image(\cdots)$ 

## Description

Creates an image component that can be used to upload images (as an input) or display images (as an output).

### Behavior

As input: passes the uploaded image as a <code>numpy.array</code>, <code>PIL.Image</code> or <code>str</code> filepath depending on <code>type</code>.

For SVGs, the <code>type</code> parameter is ignored and the filepath of the SVG is returned.

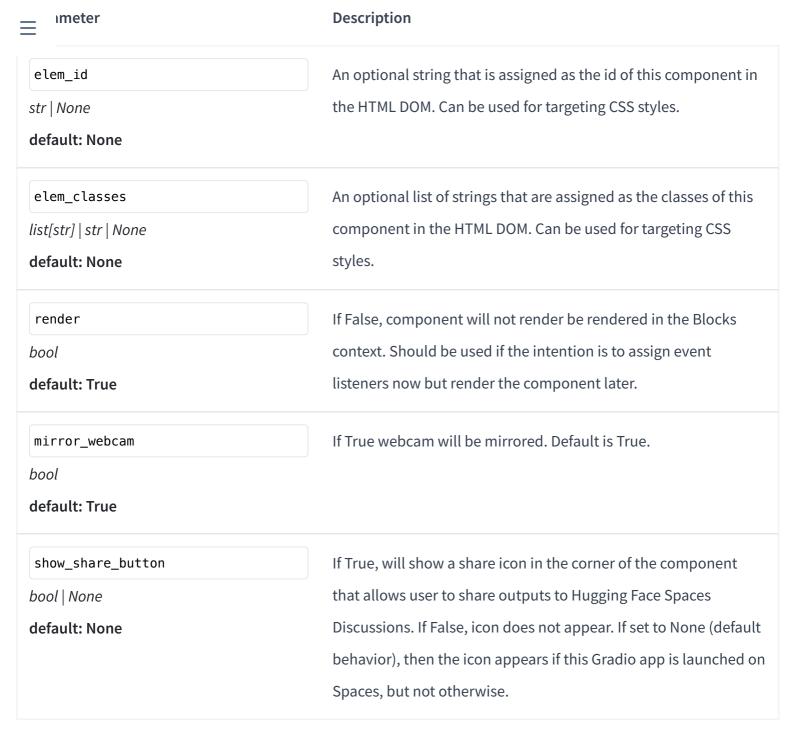

As output: expects a <code>numpy.array</code>, <code>PIL.Image</code> or <code>str</code> or <code>pathlib.Path</code> filepath to an image and displays the image.

### Initialization

Parameter	Description
value  str   _Image.Image   np.ndarray   None  default: None	A PIL Image, numpy array, path or URL for the default value that Image component is going to take. If callable, the function will be called whenever the app loads to set the initial value of the component.
<pre>height int   str   None default: None</pre>	The height of the displayed image, specified in pixels if a number is passed, or in CSS units if a string is passed.

imeter	Description	
width	The width of the displayed image, specified in pixels if a number	
int   str   None	is passed, or in CSS units if a string is passed.	
default: None		
image_mode	"RGB" if color, or "L" if black and white. See	
Literal[('1', 'L', 'P', 'RGB', 'RGBA', 'CMYK',	https://pillow.readthedocs.io/en/stable/handbook/concepts.htm	
'YCbCr', 'LAB', 'HSV', 'I', 'F')]	l for other supported image modes and their meaning.	
default: "RGB"		
sources	List of sources for the image. "upload" creates a box where user	
list[Literal[('upload', 'webcam',	can drop an image file, "webcam" allows user to take snapshot	
'clipboard')]]   None	from their webcam, "clipboard" allows users to paste an image	
default: None	from the clipboard. If None, defaults to ["upload", "webcam",	
	"clipboard"] if streaming is False, otherwise defaults to	
	["webcam"].	
type	The format the image is converted before being passed into the	
Literal[('numpy', 'pil', 'filepath')]	prediction function. "numpy" converts the image to a numpy	
default: "numpy"	array with shape (height, width, 3) and values from 0 to 255, "pil"	
	converts the image to a PIL image object, "filepath" passes a str	
	path to a temporary file containing the image. If the image is	
	SVG, the type is ignored and the filepath of the SVG is returned.	
label	The label for this component. Appears above the component and	
str   None	is also used as the header if there are a table of examples for this	
default: None	component. If None and used in a <code>gr.Interface</code> , the label will be	
	the name of the parameter this component is assigned to.	
every	If value is a callable, run the function 'every' number of seconds	
float   None	while the client connection is open. Has no effect otherwise.	
default: None	Queue must be enabled. The event can be accessed (e.g. to	
	cancel it) via this component's .load_event attribute.	

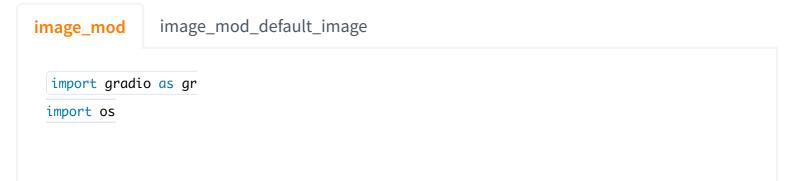

ımeter	Description	
show_label	if True, will display label.	
bool   None		
default: None		
show_download_button	If True, will display button to download image.	
bool		
default: True		
container	If True, will place the component in a container - providing som	
bool	extra padding around the border.	
default: True		
scale	relative width compared to adjacent Components in a Row. For	
int   None	example, if Component A has scale=2, and Component B has	
default: None	scale=1, A will be twice as wide as B. Should be an integer.	
min_width	minimum pixel width, will wrap if not sufficient screen space to	
int	satisfy this value. If a certain scale value results in this	
default: 160	Component being narrower than min_width, the min_width	
	parameter will be respected first.	
interactive	if True, will allow users to upload and edit an image; if False, ca	
bool   None	only be used to display images. If not provided, this is inferred	
default: None	based on whether the component is used as an input or output	
visible	If False, component will be hidden.	
bool		
default: True		
streaming	If True when used in a live interface, will automatically stream	
bool	webcam feed. Only valid is source is 'webcam'.	
default: False		

### **Shortcuts**

Class	Interface String Shortcut	Initialization
gradio.Image	"image"	Uses default values

#### Demos

### **Event Listeners**

## Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

## Supported Event Listeners

The Image component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description
gradio.Image.clear(fn, ···)	This listener is triggered when the user clears the Image using the X button for the component.
gradio.Image.change(fn, ···)	Triggered when the value of the Image changes either because of user input (e.g. a user types in a textbox) OR because of a function update (e.g. an image receives a value from the output of an event trigger). See <code>.input()</code> for a listener that is only triggered by user input.
gradio.Image.stream(fn, ···)	This listener is triggered when the user streams the Image.
gradio.Image.select(fn, ···)	Event listener for when the user selects or deselects the Image. Uses event data gradio. Select Data to carry value referring to the label of the Image, and selected to refer to state of the Image. See Event Data documentation on how to use this event data
gradio.Image.upload(fn, ···)	This listener is triggered when the user uploads a file into the Image.

## **Event Arguments**

Parameter	Description
fn  Callable   None   Literal['decorator']  default: "decorator"	the function to call when this event is triggered. Often a machine learning model's prediction function. Each parameter of the function corresponds to one input component, and the function should return a single value or a tuple of values, with each element in the tuple corresponding to one output component.
inputs  Component   list[Component]    set[Component]   None  default: None	List of gradio.components to use as inputs. If the function takes no inputs, this should be an empty list.
outputs  Component   list[Component]   None  default: None	List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.
api_name  str   None   Literal[False]  default: None	defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that gr.load this app) will not be able to use this event.
scroll_to_output  bool  default: False	If True, will scroll to output component on completion
show_progress	If True, will show progress animation while pending

Literal[('full', 'minimal', 'hidden')]

default: "full"

If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the queue setting of the gradio app.  If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to
meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to
length max_batch_size). The function is then required to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to one output component.
Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)
If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the mage component).
If False, will not run postprocessing of component data before returning 'fn' output to the browser.
A list of other events to cancel when this listener is triggered.  For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another

functions that are currently running will be allowed to finish.

Description

**Parameter** 

Parameter	Description
every float   None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be
default: None	enabled.
trigger_mode	If "once" (default for all events except .change()) would not
Literal[('once', 'multiple', 'always_last')]	allow any submissions while an event is pending. If set to
None	"multiple", unlimited submissions are allowed while
default: None	pending, and "always_last" (default for <a href="mailto:change">. change</a> () event)
	would allow a second submission after the pending event is complete.
js	Optional frontend js method to run before running 'fn'. Input
str   None	arguments for js method are values of 'inputs' and 'outputs',
default: None	return should be a list of values for output components.
concurrency_limit	If set, this is the maximum number of this event that can be
int   None   Literal['default']	running simultaneously. Can be set to None to mean no
default: "default"	concurrency_limit (any number of this event can be running
	simultaneously). Set to "default" to use the default
	concurrency limit (defined by the default_concurrency_limit)
	parameter in Blocks.queue(), which itself is 1 by default).
concurrency_id	If set, this is the id of the concurrency group. Events with the
str   None	same concurrency_id will be limited by the lowest set
default: None	concurrency_limit.
show_api	whether to show this event in the "view API" page of the
bool	Gradio app, or in the ".view_api()" method of the Gradio
default: True	clients. Unlike setting api_name to False, setting show_api
	to False will still allow downstream apps to use this event. If
	fn is None, show_api will automatically be set to False.
