Plot

gradio.Plot(⋅⋅⋅)

Description

Used to display various kinds of plots (matplotlib, plotly, or bokeh are supported).

Behavior

As input: this component does *not* accept input.

As output: expects either a <code>matplotlib.figure.Figure</code>, a <code>plotly.graph_objects._figure.Figure</code>, or a <code>dict</code> corresponding to a bokeh plot (json_item format)

Initialization

value

Parameter	Description
	•

Callable | None | pd.DataFrame

default: None

Optionally, supply a default plot object to display, must be a matplotlib, plotly, altair, or bokeh figure, or a callable. If callable, the function will be called whenever the app loads to set the initial value of the component.

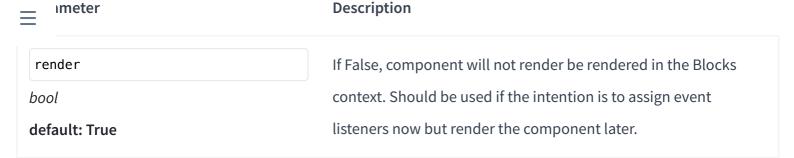

label

str | None

default: None

The label for this component. Appears above the component and is also used as the header if there are a table of examples for this component. If None and used in a <code>gr.Interface</code>, the label will be the name of the parameter this component is assigned to.

ımeter	Description
every float None default: None	If value is a callable, run the function 'every' number of seconds while the client connection is open. Has no effect otherwise. Queue must be enabled. The event can be accessed (e.g. to cancel it) via this component's .load_event attribute.
show_label bool None default: None	if True, will display label.
container bool default: True	If True, will place the component in a container - providing some extra padding around the border.
scale int None default: None	relative width compared to adjacent Components in a Row. For example, if Component A has scale=2, and Component B has scale=1, A will be twice as wide as B. Should be an integer.
min_width int default: 160	minimum pixel width, will wrap if not sufficient screen space to satisfy this value. If a certain scale value results in this Component being narrower than min_width, the min_width parameter will be respected first.
visible bool default: True	If False, component will be hidden.
elem_id str None default: None	An optional string that is assigned as the id of this component in the HTML DOM. Can be used for targeting CSS styles.
elem_classes list[str] str None default: None	An optional list of strings that are assigned as the classes of this component in the HTML DOM. Can be used for targeting CSS styles.

Shortcuts

Class	Interface String Shortcut	Initialization
gradio.Plot	"plot"	Uses default values

Demos

Event Listeners

Description

Event listeners allow you to capture and respond to user interactions with the UI components you've defined in a Gradio Blocks app. When a user interacts with an element, such as changing a slider value or uploading an image, a function is called.

Supported Event Listeners

The Plot component supports the following event listeners. Each event listener takes the same parameters, which are listed in the Event Arguments table below.

Listener	Description
gradio.Plot.change(fn, ···)	Triggered when the value of the Plot changes either because of user input (e.g. a user types in a textbox) OR because of a function update (e.g. an image receives a value from the output of an event trigger). See Linput() for a listener that is only triggered by user input.
gradio.Plot.clear(fn, ···)	This listener is triggered when the user clears the Plot using the X button for the component.
Event Arguments	
Parameter	Description
Parameter	Description the function to call when this event is triggered. Often a
fn	the function to call when this event is triggered. Often a
fn Callable None Literal['decorator']	the function to call when this event is triggered. Often a machine learning model's prediction function. Each
fn Callable None Literal['decorator']	the function to call when this event is triggered. Often a machine learning model's prediction function. Each parameter of the function corresponds to one input
fn Callable None Literal['decorator']	the function to call when this event is triggered. Often a machine learning model's prediction function. Each parameter of the function corresponds to one input component, and the function should return a single value or

 inputs
 List of gradio.components to use as inputs. If the function

 Component | list[Component] |
 takes no inputs, this should be an empty list.

 set[Component] | None

default: None

str | None | Literal[False]

outputs

api_name

default: None

List of gradio.components to use as outputs. If the function returns no outputs, this should be an empty list.

Component | list[Component] | None returns no outputs, this should be an empty list.

default: None

defines how the endpoint appears in the API docs. Can be a string, None, or False. If set to a string, the endpoint will be exposed in the API docs with the given name. If None (default), the name of the function will be used as the API endpoint. If False, the endpoint will not be exposed in the API docs and downstream apps (including those that

gr.load this app) will not be able to use this event.

Parameter	Description
scroll_to_output bool default: False	If True, will scroll to output component on completion
show_progress Literal[('full', 'minimal', 'hidden')] default: "full"	If True, will show progress animation while pending
queue bool None default: None	If True, will place the request on the queue, if the queue has been enabled. If False, will not put this event on the queue, even if the queue has been enabled. If None, will use the queue setting of the gradio app.
bool default: False	If True, then the function should process a batch of inputs, meaning that it should accept a list of input values for each parameter. The lists should be of equal length (and be up to length <pre>max_batch_size</pre>). The function is then required to return a tuple of lists (even if there is only 1 output component), with each list in the tuple corresponding to one output component.
<pre>max_batch_size int default: 4</pre>	Maximum number of inputs to batch together if this is called from the queue (only relevant if batch=True)
preprocess bool default: True	If False, will not run preprocessing of component data before running 'fn' (e.g. leaving it as a base64 string if this method is called with the Tmage component).
postprocess bool	If False, will not run postprocessing of component data before returning 'fn' output to the browser.

default: True

Parameter	Description
cancels dict[str, Any] list[dict[str, Any]] None default: None	A list of other events to cancel when this listener is triggered. For example, setting cancels=[click_event] will cancel the click_event, where click_event is the return value of another components .click method. Functions that have not yet run (or generators that are iterating) will be cancelled, but functions that are currently running will be allowed to finish.
every float None default: None	Run this event 'every' number of seconds while the client connection is open. Interpreted in seconds. Queue must be enabled.
trigger_mode Literal[('once', 'multiple', 'always_last')] None default: None	If "once" (default for all events except .change()) would not allow any submissions while an event is pending. If set to "multiple", unlimited submissions are allowed while pending, and "always_last" (default for .change() event) would allow a second submission after the pending event is complete.
js str None default: None	Optional frontend js method to run before running 'fn'. Input arguments for js method are values of 'inputs' and 'outputs', return should be a list of values for output components.
<pre>concurrency_limit int None Literal['default'] default: "default"</pre>	If set, this is the maximum number of this event that can be running simultaneously. Can be set to None to mean no concurrency_limit (any number of this event can be running simultaneously). Set to "default" to use the default concurrency limit (defined by the default-concurrency_limit parameter in Blocks.queue (), which itself is 1 by default).
concurrency_id str None default: None	If set, this is the id of the concurrency group. Events with the same concurrency_id will be limited by the lowest set concurrency_limit.

Description

show_api

bool

default: True

whether to show this event in the "view API" page of the Gradio app, or in the ".view_api()" method of the Gradio clients. Unlike setting api_name to False, setting show_api to False will still allow downstream apps to use this event. If fn is None, show_api will automatically be set to False.
